

Advances in Food Dehydration (Contemporary Food Engineering)

Comprehensive Assessment of This Globally Relevant Practice As a centuries-old food preservation method, dehydration technology has advanced significantly in the past decades as a result of new methods, sophisticated analytical techniques, and improved mathematical modeling. Providing practical and expert insight from an international panel of experts, *Advances in Food Dehydration* encompasses these revolutionary advances and effectively supplies the knowledge base required to optimize natural resources and reduce energy requirements in order to meet growing demand for low-cost, high-quality food products. Discusses Ways to Best Optimize Natural Resources Under the editorial guidance of food engineering and dehydration authority Cristina Ratti, this resource addresses the three biggest challenges associated with food dehydration: The complex nature of food systems together with the deep structural and physico-chemical changes that foodstuffs undergo during processing The difficulty to define quality in quantitative terms and to develop appropriate control techniques The lack of realistic models and simulations to represent the phenomena The books well-developed chapters explain the structural and physico-chemical changes that food undergoes during dehydration, while discussing ways to optimize natural resources. In addition to describing non-convectonal heating sources such as microwaves, infrared, and radio frequency, the text also examines the impact of drying on nutraceutical compounds, the bases of rehydration of dry food particles and the stresses on microorganisms during drying and their stability during storage. *Advances in Food Dehydration* is a user-friendly volume that concisely links the gamut of dehydration concepts into one cohesive reference. About the Editor: Cristina Ratti, Ph.D., is a food engineering professor in the Soils and Agri-Food Engineering

Department at the Université Laval (Quebec). She is the coordinator of the Food Engineering Program and a member of the Institute of Nutraceutical and Function Foods (INAF). She has published numerous scientific manuscripts related to her research interests in food dehydration as well as physiochemical and quality properties of foodstuffs related to drying.
